**EXAMINATION REPORT - SEPARATE SHEET** 

## Re Item Lack of unity of invention

#### Unity of invention (Rule 13 PCT): 1.

The arguments put forwards by the applicant have been taken into consideration and the IPEA came to the following conclusion:

From the arguments it is understood that the common liking concept between the different allelic variants is in the fact that they affect the functionality of the factor VII but also the levels at which the protein is found.

Nevertheless, the prior art also refers to the mutations in the factor VII gene and correlates this mutation with a reduced plasma level of the protein (see especially D3). Therefore, the argument are not considered as convincing and the objection for lack of unity is maintained and is as follows:

Claim 1 of the present application concerns nucleic acid variants of the gene coding for factor VII, the variants being characterised by the mutations as listed in table 1. D1-D5 disclose factor VII gene variants responsible for the production of the deficient protein essential for the initiation phase of normal haemostasis. Because the concept of factor VII gene variants inducing the production of deficient proteins leading to cardiovascular diseases is known, no common inventive concept for the different variants claimed can be found. Therefore, the present claim 1 concerns different solutions to the single problem of finding new variants producing the deficient protein, all these solutions being not so linked as to form a single inventive concept (Rule 13 PCT). It is concluded that each variant listed in table 1 represents a different solution and thereby a distinct invention.

Further, it is brought to the applicant's attention that according to the new PCT guidelines (see Guidelines Part III, 10.54) there is no unity of invention between alternative chemical compounds (in the present case nucleic acid molecules having polymorphisms at given positions) if they do not share a significant structural element that is essential to the common property or activity.

### Re Item V

Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

Reference is made to the following documents: 1.

### INTERNATIONAL PRELIMINARY **EXAMINATION REPORT - SEPARATE SHEET**

International application No. PCT/ES 03/00379

D1: THROMBOSIS RESEARCH, vol. 98, 2000, pages 9-17

D2: HUMAN MUTATION, vol. 15, n° 6, 2000, pages 489-496

D3: BLOOD, vol. 93, n° 10, 1999, pages 3432-3441

D4: ARTERIOSCLEROSIS AND THROMBOSIS, vol. 11, n° 3, 1991, pages 540-546

D5: HUMAN GENETICS, vol. 90, n° 5, 1993, pages 575-576

#### Novelty (Article 33(2) PCT): 2.

By deleting the allelic variant having a T/C substitution at position -122 from the list of variants of claim 1, novelty has been established. Therefore, since the allelic variants listed in the claims are not disclosed in the D1-D5, claims 1-9 are considered novel and fulfil the requirements of Article 33(2) PCT.

#### Inventive merit (Article 33(3) PCT): 3.

The argumentation as well as the "enclosure 2" provided by the applicant to justify an inventive merit have been taken into consideration. The following is nevertheless to be considered.

In the "enclosure 2" on page 13, last paragraph it is stated that "Obviously, it is very important to unravel the nature of these polymorphisms (allelic variants of the application) with biological studies of in vitro expression to exactly characterise the nature of these variants, to confirm their functionality, and to distinguish among the markers in the three highly correlated clusters".

According to this statement it appears that it is not clear which allelic variants (if any) really are responsible for the disease and are susceptible to be used in the manufacture of a medicament. Therefore, the objection for lack of inventive merit of the claims is maintained as follows:

D2, which is considered to be the closest prior art, concerns various mutations 3.2 of the factor VII gene leading to deficiency of the protein, essential for the initiation phase of normal haemostasis. The oligonucleotides molecules of present claim 1 distinguish themselves from the mutations of D2 by position in the gene for the mutation. No technical effect is achieved by these different allelic variants, therefore, the problem to be solved by the present claim 1 is to provide new allelic variants affecting the activity of factor VII.

No indication in the prior art documents D1-D5 taken separately or together, is to be found that would allow the skilled person to anticipate which region of the gene and which polymorphism could induce the alteration of the factor VII protein.

Nevertheless, in the absence of evidence that the variants listed in the present table 1 do solve the problem of providing new polymorphisms demonstrating

# INTERNATIONAL PRELIMINARY

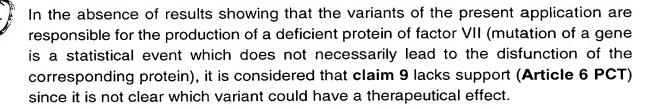

International application No. PCT/ES 03/00379

**EXAMINATION REPORT - SEPARATE SHEET** 

that the activity of factor VII is altered by the polymorphism (see item 5.1 below). it is considered that the variants do not solve the problem of the application. Therefore, claim 1 of the present application is considered not to fulfil the requirements of Article 33(3) PCT.

- Following the same reasoning for claims 3-7 leads to the conclusion that these claims do not introduce any feature susceptible of an inventive merit over D2 since this document does also disclose probes used for the detection of mutations in the factor VII gene.
- 3.4 Furthermore, since it is not clear which variants of table 1 will lead to a defective factor VII protein, it is not possible to determine, at this stage, which of these variants are suitable for the development of a therapeutic, preventive or diagnostic approach or for the manufacture of a medicament. Therefore, claims 2 and 8-9 are at present not considered to fulfil the requirements of Article 33(3) PCT.
- 3.5 It is concluded that claims 1-9 of the present application do not fulfil the requirements of Article 33(3) PCT.
- Industrial applicability (Article 33(4) PCT): 4.

Due to the nature of the claims, an industrial applicability of the invention is obvious and claims 1-9 are considered to fulfil the requirements of Article 33(4) PCT.

Claims 8 and 9 relate to the use of nucleic acid molecules for the preparation of 6. medicament or approaches for the treatment of cardiovascular diseases. Since cardiovascular diseases encompass a group of diseases, the scope of these claims hipografico - quitar is unclear (Article 6 PCT). - error

1

### NEW ALLELIC VARIANTS IN THE FACTOR VII GENE

### FIELD OF THE INVENTION

5 The present invention relates to the field of cardiovascular diseases.

In particular, the present invention relates to the identification of new allelic variants in the factor VII gene sequence for determining the predisposition to a. 10 cardiovascular disease.

### BACKGROUND OF THE INVENTION

Factor VII is a vitamin K-dependent glycoprotein 15 synthezised in the liver and secreted into the blood as an inactive zymogen at a concentration of 0.5 µg/ml<sup>51</sup> (Faith Blood, 1983). Following endothelial damage, the tissue factor (TF) is exposed and it binds to the Factor VII, setting up a coagulation reaction (Psterud. Proc. Natl. 20 Acad. Sci. USA, 1977: Bauer et al., Blood, 19945.

The gene that encodes the Factor VII is located on 13q34-q.ter (Pfeiffer et al., 1982: Gilgenkrantz et al., A98 (), contains 9 exons and 8 introns of 12.8 kb and codes for a protein of 406 amino acids. The complete gene 25 sequence for human Factor VII was determined by O'Hara el al. (O'Hara P.J. et al., "Nucleotide sequence of the gene coding for human factor VII, a vitamin K-dependent protein participating in blood coagulation"; Proc. Natl. U.S.A. 84:5158-5162 (1987). The 30 polyadenylated in multiple positions and has an efficient differential splicing. The mature protein has a molecular mass of approximately 50 KDa.

The activated form of the factor VII consists on one heavy chain and one light chain, both coded by the 35 same gene, and linked by a disulphur bond between the

- [3] = Bauer K.A., Kass B.L., ten Cate H., Hawiger J.J, Rosenberg R.D. Factor IX is activated in vivo by the tissue factor mechanism. Blood 1990; 76: 731-736.
- [4]= Pfeiffer, R. A.; Ott, R.; Gilgenkrantz, S.; Alexandre, P. Deficiency of coagulation factors VII and X associated with deletion of a chromosome 13 (q34): evidence from two cases with 46,XY,t(13;Y)(q11;q34). Hum. Genet. 1982; 62: 358-360
  - [5] = Gilgenkrantz, S.; Briquel, M.-E.; Andre, E.; Alexandre, P.; Jalbert, P.; Le Marec, B. et al. Structural genes of coagulation factors VII and X located on 13q34. Ann. Genet. 1986; 29: 32-35

cysteine 135 and the cysteine 262 (Hagen et al., 1986). It contains two EGF domains (epidermal growth factor domain), one Gla domain (γ-carboxyglutamic acid domain) and one trypsin-like catalytic domain (Hagen et. al., Natl. Acad. 5 Sci. USA, 1984).

The heavy chain includes the catalytic part of the molecule and the heavy chain contains the Gla domain involved in the Ca<sup>2+</sup> binding and the membrane binding,

which are essential for factor VII activity.

The factor VII heavy-chain variants involve the direct interference in the activation process or the interruption of the catalytic mechanism, whereas most of the light-chain variants interrupt the interactions with Ca<sup>2+</sup> or with membrane components which results in dysfunctional molecules (Pheng et al., Blood Coagul; Fibrinel, 1994).

Heriditary factor VII deficiency is an uncommon disorder showing autosomal recessive inheritance with high penetrance and variable expressivity (\*\*wuffer et al., 1960); 29 \*\*Triplet et al., 1965).\* It has an incidence of 1 per 500,000 in the general population (\*\*wulf and Hermann. Hum.) \*\*Mutation 15, 2000)\*\* and was recognized for the first time by Alexander et al., 1951. Some of the factor VII gene mutations have been identified and affect all domains of 25 the protein, although about 50% of said mutations affect the protease domain (\*\*wulff and Hermann, Hum. mutations) \*\*2000)\*\*, which indicates that the loss of protease function is the main cause of factor VII deficiency.

In general, the most common forms of disorder 30 involve the presence of dysfunctional factor VII, which consists in low antigen levels in the plasma and a lengthening of prothrombin time due to defective activity of these molecules.

An absence of factor VII activity in plasma causes 35 severe haemorrhage shortly after birth; indeed, there are

- [8] = Zheng DQ, Shurafa M, James HL. Factor VII G331D: a variant molecule involving replacement of a residue in the substrate-binding region of the catalytic domain. Blood Coagul Fibrinolysis. 1996 Jan;7(1):93-6.
- [9] = Kupfer, H. G.; Hanna, B. L.; Kinne, D. R.: Congenital factor VII deficiency with normal Stuart activity: clinical, genetic and experimental observations. Blood 15: 146-163, 1960.
- [10] = Triplett, D. A.; Brandt, J. T.; Batard, M. A. M.; Dixon, J. L. S.; Fair, D. S.: Hereditary factor VII deficiency: heterogeneity defined by combined functional and immunochemical analysis. Blood 66: 1284-1287, 1985.
- [11], [12] = Wulff, K.; Herrmann, F. H.: Twenty two novel mutations of the factor VII gene in factor VII deficiency. Hum. Mutat. 15: 489-496, 2000.

studies in which mice deficient in FVII due to targeted disruption of the factor VII gene suffered fatal haemorrhage in the peri-partum period (MeVey et al., Hum! hutation, 2004).

Moreover, about 30-40% of the variation of FVIIa levels in the general population can be explained by the existence of polymorphisms in the FVII gene (Bernardi et lat., Blood 1996). These polymorphisms or allelic variants nevertheless show different allelic frequencies in different populations (Green et al., Arterioscler) [Thromb., 1991; Bernardi, Marchetti, Pinotti, Arterioscler] [Thromb., Vasc. Biol., 1996]. <15,16)

These allelic variants have been associated with varied risk of suffering from cardiovascular diseases, 15 although the studies in which such an association has been described are contradictory and in no instance conclusive (Firelli et al., New England J. Med., 2000; Iacoviello et pl., N. Eng. J. Med., 1988). Furthermore, all the studies suffer from design errors and lack of statistical power.

and methodology used date to to The design 20 approach "the study of cardiovascular disease were based on investigating for presence of the risk factor in healthy individuals (controls) and disease sufferers (cases) who were unrelated to each other. Where the hypothetical risk 25 factor was observed more frequently (in statistical terms) in the cases than in the controls it was concluded that the disease was associated with the factor under study. Strictly, however, a relationship of association does not necessary imply causation. This type of study, so-called 30 Association or Case/Control Study, is entirely unsuitable for investigating genetic causes of complex illnesses, such as cardiovascular disease (Sambaro et al., Lancet 2000 Conventional epidemiological studies serve to identify environmental causes of illness (such as 35 the smoking habit and lung cancer, oral contraceptives and

venous thrombosis, or a vitamin-C-deficient diet and scurvy), but are highly ineffective when it comes to involved. However, owing to the locating the genes widespread use of PCR techniques in clinical laboratories, 5 there are large numbers of Association Studies that relate in certain candidate genetic variants (polymorphisms) genes with all kinds of illnesses. Much confusion has been relating to the results because caused, polymorphism are often contradictory. Neither has the for both venous and 10 study of cardiovascular disease, arterial types, remained free from this methodological perversion nor from the attendant chaotic collection of results (Firelli et al., New Eng. J. Med., 2000; Facoviello et al., N. Eng. J. Med. 1998,). - (20,21> 15

# DESCRIPTION OF THE INVENTION

The present invention relates to a molecule of nucleic acid comprising a sequence of the gene that codes 20 for factor VII, characterized in that said molecule includes at least one allelic variant, said allelic variant affecting to the stability and/or functionality of said nucleic acid molecule, of the product obtained by transcription of said nucleic acid molecule and/or of the 25 product coded by said nucleic acid molecule.

In the present invention, "nucleic acid molecule" is taken to mean a DNA sequence from the gene coding for factor VII protein. The length of said sequence is not an 30 essential or restrictive aspect of this invention.

In the present invention, "allelic variant" is taken to mean a genetic variation in the DNA sequence that codes for factor VII protein, said genetic variation 35 involving a pathology, loss or gain of stability and/or

### CLAIMS

1. Molecule of nucleic acid which comprises a sequence of the gene that codes for factor VII, 5 characterized in that said molecule includes at least one allelic variant, said allelic variant affecting the stability and/or functionality of said nucleic acid molecule and/or of the product coded by said nucleic acid molecule.

10

2. Molecule of nucleic acid according to Claim-1, characterised in that the presence of at least one of said allelic variants is indicative of a predisposition to a cardiovascular disease.

15

- 20 <1>A. Isolated product coded by a nucleic acid molecule according to pay of Claim 1 to 3, for use as a medicament.
- (3) \$5. Allele-specific oligonucleotide which 25 hybridizes with a nucleic acid molecule as claimed in any/ /of/ Claims 1 to 3, in which the nucleotide of the polymorphic locus of said allele-specific oligonucleotide is different from the nucleotide of the polymorphic locus of the reference allele.

30

 $\langle 4 \rangle \emptyset$ . Oligonucleotide as claimed in Claim  $\downarrow \beta$ , characterised in that it is a probe.
